1. Executive Summary

Prismo Constructions is a construction consultancy company located in Sri Lanka which has hitherto offered professional consultation services. The company is at present carrying out a strategic move to enter the field of full construction management in addition to the consultancy services it already provides. This expansion is still in its early and continuing phases. To facilitate this growth, the company has recently hired new employees and set up the relevant stakeholders to assist with the construction management duties, such as project managers, site engineers, and other operational staff.

Currently, the traditional consultancy activities as well as the new construction management activities depend greatly on manual and fragmented procedures. Interaction with clients, preparing and revising proposals and budgets, setting up projects following client acceptance, assigning tasks, keeping track of daily site progress, taking photographic records, reporting issues, and obtaining client approvals are all carried out mainly by means of emails, WhatsApp messages, and the sharing of unstructured documents. This approach does not provide real-time visibility, ensures proper accountability, or establish a single source of truth.

The continuous business expansion together with the fact that new staff members have been appointed leads to major operational difficulties. The new employees must work with processes that are still in an early stage, information is frequently delayed or incomplete, there is poor coordination between the consultancy and construction management teams, and the clients get only limited transparency. If there is no proper digital support in place, the organisation will face lower efficiency, more errors, slower decision-making, and trouble in scaling its new construction management services.

The Business Architecture Assessment looks at the present business operations of Prismo Constructions, identifies the main internal and external stakeholders (including the newly hired construction management staff), investigates the weaknesses in the existing processes, and assesses the need for digital transformation. The suggested course of action is to introduce a centralised, role-based digital system which will cover the entire lifecycle from the initial client consultation and the acceptance of the proposal via project setup, task management, the recording of site progress, and secure collaboration with clients. This approach will provide a solid basis for the company's expansion, improve operational control, increase transparency, and allow for sustainable growth in its construction management services.

2. Organization Profile

Organization Name

Prismo-Constructions

Industry Sector

Construction consultancy and construction management services in the built environment sector in Sri Lanka.

Size

Prismo-Constructions is a small to medium-sized organization. It works with a lean core team and has recently hired new employees to support its expanding construction management function. The organization currently has a flat structure with a few specialized roles.

Products / Services

The company has mainly offered construction consultancy services. These services include client consultation, feasibility advice, proposal preparation, cost planning, and budget estimation. To support its growth, Prismo-Constructions is moving into full construction management services. These services involve setting up and planning projects after client approval, assigning tasks to site teams, monitoring site progress, coordinating daily operations, managing documents, and maintaining clear communication and approvals with clients.

Organizational Structure

The organization is led by the CEO, who gives overall strategic direction and is the main decision-maker. Supporting roles include Assistant Project Manager, Quantity Surveyor (QS), Project Managers, and recently hired Site Engineers along with related operational staff for construction management. Administrative and support staff manage basic documentation and coordination. External stakeholders include the company's clients who hire Prismo for consulting and, more often, for construction management services.

Current Business Environment

Prismo-Constructions is working in a competitive construction sector in Sri Lanka. The company is currently transitioning from pure consultancy to integrated construction management. This change has brought new operational demands and new staff who are still getting used to the changing processes. The business environment requires faster coordination, more transparency for clients, and better control over multiple projects as the organization grows.

Existing Information Systems

Prismo-Constructions has a company website ([Prismo Constructions](#)) that acts as a marketing and information platform for its consultancy services. However, the organization does not have an integrated system to manage its core business processes. Daily tasks related to client consultation, proposal and budget preparation, project setup after client approval, task assignment, site progress tracking, photo documentation, issue reporting, and client approvals are mainly done through manual and scattered tools like email, WhatsApp, spreadsheets, and unstructured digital file sharing. There is no central platform that supports the entire operational lifecycle. This

creates problems with information consistency, real-time visibility, and process control, especially as the company expands into construction management services with new staff.

3. Business Problem Statement

Prismo-Constructions is facing several connected operational and business challenges due to its expansion from construction consultancy to full construction management services. While the organization has successfully offered consultancy services in the past, adding construction management responsibilities and bringing in new employees has revealed major limitations in its current methods.

Current Operational Issues

Day-to-day operations remain heavily dependent on manual and fragmented tools. Client inquiries, proposal preparation, budget estimation, client feedback and acceptance, project creation, task assignment, daily site progress reporting, photo documentation, issue tracking, and client approvals are primarily managed through email, WhatsApp messages, spreadsheets, and unstructured file sharing. There is no single, reliable source of project information. As a result, progress updates are often delayed or incomplete, documents are difficult to locate or version-control, and coordination between the consultancy team, newly appointed site engineers, and clients is inefficient. Newly recruited staff, in particular, face difficulties adapting to inconsistent and undocumented processes.

Business Challenges

These operational weaknesses create bigger business challenges. The lack of real-time visibility makes it hard for management to monitor multiple projects effectively. Accountability suffers because task ownership and status of progress are not clearly recorded. Clients face limited transparency, which can lower satisfaction and trust. As the amount of construction management work grows, the current approach becomes harder to manage. The mix of business growth and reliance on manual methods raises the risk of coordination errors, delayed decision-making, higher administrative effort, and lower service quality.

Why Digital Transformation is Required

Digital transformation is necessary to create a stable operational foundation. This foundation must support both current consultancy services and the new construction management function. A centralized, role-based digital platform would replace scattered communication channels with organized workflows. It would improve information accuracy and accessibility, strengthen accountability, enable real-time progress visibility, and provide clients with a clear way to collaborate. Without this transformation, the organization will find it difficult to manage growth effectively, integrate new staff productively, and keep up competitive service standards.

Scope of the Assessment

This Business Architecture Assessment focuses on the key business processes of Prismo-Constructions that are most impacted by the move into construction management. The scope covers the entire flow from client consultation and proposal handling to project setup, task and resource coordination, site progress capture, and client collaboration. The assessment looks at current (As-Is) processes, identifies key stakeholders, including the new construction management staff, examines process weaknesses, and lays the groundwork for defining the

future (To-Be) business architecture. Technical design, system implementation, and administrative processes not related to the core remain outside the scope of this assessment.

4. Stakeholder Analysis

Stakeholder analysis identified all individuals and groups who can influence or are affected by the digital transformation project at Prismo-Constructions. The process looked at the organization's current structure, its growth into construction management, and the new roles created to support this growth.

The methods used to identify stakeholders included:

- Reviewing the organization's current structure and existing roles
- Discussing current and new responsibilities with key client representatives
- Analyzing the entire business process from client consultation to project execution and collaboration
- Considering both internal operational staff and external parties affected by the change
- Recognizing newly appointed employees specifically hired for construction management functions

Based on this analysis, stakeholders were classified as Internal or External, and their roles were defined concerning the digital transformation initiative.

4.1 Stakeholder Identification

Table 4.1.1: Stakeholder Identification

Stakeholder	Internal/ External	Role / Responsibility
CEO	Internal	Overall strategic leader and primary project sponsor. Provides final approval on major decisions, budget allocation, and the direction of digital transformation.
Assistant Project Manager	Internal	Supports the CEO and Project Managers in daily coordination, process integration, and monitoring of both consultancy and construction management activities.
Quantity Surveyor (QS)	Internal	Responsible for cost planning, preparation of Bills of Quantities (BOQ), budget estimation, valuations, and financial control of projects.
Project Managers	Internal	Manage individual client projects from acceptance stage onwards. Oversee planning, task allocation, progress monitoring, and coordination between office and site teams.
Site Engineers / Site Supervisors	Internal	Newly appointed roles supporting the expansion into construction management. Responsible for on-site supervision, daily progress logging, photo uploads, issue reporting, and updating task status.
Administrative & Support Staff	Internal	Handle documentation, basic record keeping, filing, and general administrative support for both consultancy and construction management functions.
Finance / Accounts Staff	Internal	Manage invoicing, payments, basic financial records, and support cost-related information for projects (where applicable).
Clients of Prismo Constructions	External	Engage the company for consultancy services and, increasingly, for construction management. They review proposals, provide

		feedback, approve or request changes, and require transparent project visibility.
End-Client Stakeholders (Client's side)	External	Decision-makers or representatives from the client organisation who interact with Prismo during consultation, proposal review, and project execution stages.
4-Students of Project Team	Internal (to the project)	Responsible for conducting the Business Architecture Assessment, designing the future state, and developing platform as part of the academic consultancy engagement.
Module Lecturers / Instructor's	External	Assess the quality, accuracy, and completeness of the Business Architecture Assessment Report and related project deliverables.
Future System Administrator / IT Support	Internal	Will be responsible for maintaining the new digital platform after implementation and supporting users (currently limited or non-existent).

4.2 Stakeholder Matrix

Table 4.2.1: Stakeholder Matrix Table View

Stakeholder	Role	Interest	Influence	Impact	Engagement Strategy
CEO	Strategic leader and project sponsor	High	High	High	Manage Closely
Assistant Project Manager	Daily coordination and process support	High	Medium	High	Manage Closely
Quantity Surveyor	Cost planning and budget control	High	Medium	High	Keep Informed
Project Manager	Project planning and execution oversight	High	High	High	Manage Closely
Site Engineer	On-site progress tracking and reporting	High	Medium	High	Keep Informed + Train
Administrative Officer	Documentation and administrative support	Medium	Low	Medium	Keep Informed
Accounts Officer	Financial records and cost support	Medium	Low	Medium	Monitor
Client (Project Owner)	Engages services and requires visibility	High	Medium	High	Keep Informed
Client Representative	Handles feedback and approvals	High	Medium	High	Keep Informed
Student Project Team Member	Conduct assessment and system development	High	High	High	Manage Closely
Module Lecturer /Instructor	Assesses project deliverables	Medium	High	Medium	Keep Satisfied
System Administrator (Future)	Will maintain the new platform	Medium	Low	Medium	Monitor

4.3 Stakeholder Classification

Stakeholders were classified using the Power-Interest Grid (Mendelow's Matrix). This classification helps identify the best way to engage with each stakeholder group based on their level of power and interest in the digital transformation project.

Figure 4.3.1: Power-Interest Grid

Table 4.3.1: Stockholders Classification Table

Quadrant	Stakeholders	Recommended Approach
Manage Closely	CEO, Project Manager, Assistant Project Manager, Student Project Team Member	Active involvement in decisions, regular updates, and close collaboration
Keep Satisfied	Module Lecturer / Academic Evaluator	Provide timely, high-quality deliverables and maintain professional communication
Keep Informed	Quantity Surveyor, Site Engineer, Client (Project Owner), Client Representative, Administrative Officer	Regular progress updates, training (especially for Site Engineers), and clear communication channels
Monitor	Accounts Officer, System Administrator (Future)	Periodic updates only; minimal active engagement required at this stage

4.4 Stakeholder Impact Analysis

The stakeholder analysis reveals clear differences in influence and impact across the identified groups. The most influential stakeholders are the CEO, Project Managers, and the Assistant Project Manager. These individuals hold significant decision-making authority and can directly affect the direction, prioritisation, and acceptance of the digital transformation. The Student Project Team also holds high influence within the project context, as they are responsible for designing and delivering the proposed solution. Their active involvement is essential for aligning the future system with actual business needs.

The most affected stakeholders are the Site Engineers, Project Managers, and Clients. Site Engineers, many of whom are newly appointed as part of the organisation's expansion into construction management, will experience the greatest change in their daily work. They will be required to shift from informal reporting methods (such as WhatsApp and verbal updates) to structured digital logging of progress, photos, and issues. Project Managers will also be significantly affected, as they must adapt to new workflows for task assignment, progress monitoring, and coordination. Clients will be impacted through the introduction of a formal collaboration portal, which changes how they receive updates and provide approvals.

Possible resistance is most likely to arise from Site Engineers and some existing staff who are accustomed to flexible, informal communication methods. Newly appointed employees may feel uncertain about using unfamiliar digital tools, while longer-serving staff may perceive the new system as additional administrative work. Resistance may also occur if users feel they were not adequately consulted during the design stage. Clients may show mild resistance if the new portal appears complex or requires extra effort compared to current email-based communication.

Effective communication is therefore critical. High-influence stakeholders (CEO and Project Managers) require regular progress meetings, demonstrations, and involvement in key decisions. Site Engineers need clear training, simple user guidance, and ongoing support to reduce anxiety and build confidence. Clients should receive straightforward explanations of the benefits, particularly improved transparency and faster response times. Consistent, two-way communication will help manage expectations, reduce resistance, and support successful adoption of the new digital platform across the expanding organisation.

5 Define the process scope

Table 5.1: Epic 1 - Project & Portfolio Management process scope

Item	Student Response
Process name	Project & Portfolio Management Process
Triggering event	The client officially accepts the proposal/budget submitted by Prismo Constructions and confirms that the company should proceed with the project.
Start point	The Project Manager or Assistant Project Manager receives the client's formal acceptance (usually via email or WhatsApp) and decides to create the project record.
End point or points	1. The new project is created and recorded. 2. Key milestones are defined and documented. 3. Initial project status is set (e.g., "Not Started" or "Planning"). 4. The project is visible in the organisation's overall project list / portfolio overview.
Main business objective	To formally register accepted projects, establish clear milestones, maintain up-to-date project status information, and give management a consolidated view of all ongoing and upcoming projects so that progress, priorities, and resource needs can be monitored.
Items within scope	• Receiving and confirming client acceptance • Creating a new project record (project name, client name, location, start date, expected end date, description) • Defining and recording major project milestones • Updating overall project status and high-level progress percentage • Maintaining a simple portfolio / list of all projects for management review • Basic information sharing about project status within the internal team
Items outside scope	• Initial client inquiry and consultation • Preparation and negotiation of proposals and budgets – • Creating and assigning individual tasks to site engineers – • Daily site progress logging, photo uploads, and issue reporting • Client login, document sharing, and formal approval workflows • Detailed scheduling of resources and labour • Financial management (invoicing, payments, cost tracking) - Any system configuration or technical administration

Table 5.2: Epic 2 - Site Progress & Field Capture process scope

Item	Student Response
Process name	Site Progress & Field Capture Process
Triggering event	A working day begins on the construction site, or a significant activity, milestone work, or issue occurs that needs to be recorded.
Start point	The Site Engineer arrives at the site or identifies the need to record daily progress, upload photos, or report an issue.
End point or points	1. Daily progress log is completed and submitted. 2. Progress photos are captured and shared with the relevant Project Manager. 3. Any site issues or observations are reported. 4. The Project Manager receives and acknowledges the information (usually via WhatsApp or email).
Main business objective	To capture accurate, timely information about work completed on site, visual evidence of progress, and any problems encountered, so that the Project Manager and management can monitor site performance and take necessary actions.
Items within scope	• Recording daily progress (date, weather, manpower, work done, approximate percentage completed) • Taking and uploading/sharing progress photographs with captions or notes • Reporting site issues, observations, delays, or quality concerns • Communicating the above information to the Project Manager • Basic follow-up or clarification requests related to the submitted progress or issues
Items outside scope	• Creating the project or defining milestones • Creating and assigning tasks to site engineers • Updating overall project status at portfolio level • Client access to progress information or formal client approvals • Detailed cost or quantity surveying activities • Official quality inspection reports or external audits • Any system administration or technical configuration

Table 5.3: Epic 3 - Client Collaboration Portal process scope

Item	Student Response
Process name	Client Collaboration Process
Triggering event	The client needs to view project progress, receive project documents, or provide feedback/approval on submitted information after the project has started.
Start point	The Project Manager (or Assistant Project Manager) shares project updates, progress information, photos, or documents with the client (currently via email or WhatsApp).

End point or points	1. Client has viewed the shared progress information or documents. 2. Client provides feedback, requests changes, or gives formal approval. 3. The Project Manager receives and records the client's response.
Main business objective	To keep the client informed about project progress in a transparent manner, share relevant documents, and obtain timely feedback or approvals so that the project can proceed with client agreement and reduced misunderstandings.
Items within scope	• Sharing project progress updates with the client • Sharing progress photos and related visual evidence • Sharing project documents (reports, drawings, progress summaries) • Receiving client feedback, comments, or change requests • Receiving client approval or rejection on submitted items • Basic follow-up communication related to the shared information
Items outside scope	• Creating the project or defining milestones • Daily site progress logging by Site Engineers • Creating and assigning tasks internally • Internal portfolio dashboard used by management • Financial approvals, payments, or invoicing • Initial consultation and proposal negotiation stage • Any technical system administration

Table 5.4: Epic 4 - Task & Assignment Management process scope

Item	Student Response
Process name	Task & Assignment Management Process
Triggering event	A project has been created and milestones are defined, and the Project Manager needs to break down the work into specific tasks for site execution.
Start point	The Project Manager identifies work that needs to be carried out on site and decides to create and assign tasks to Site Engineers.
End point or points	1. Tasks are created and clearly defined. 2. Tasks are assigned to the relevant Site Engineer(s). 3. Site Engineer updates the task status as work progresses. 4. Task is marked as completed (with basic evidence or confirmation).
Main business objective	To break down project work into clear, assignable tasks, allocate responsibility to Site Engineers, track the status of each task, and ensure that work is completed and recorded in a structured manner.
Items within scope	• Creating individual tasks linked to a project or milestone • Defining task details (description, priority, due date if any) • Assigning tasks to specific Site Engineers • Updating task status (e.g., To Do, In Progress, Completed) • Marking tasks as completed with basic confirmation or evidence • Basic communication between Project Manager and Site Engineer regarding task progress
Items outside scope	• Creating the overall project or defining high-level milestones • Daily progress logging and photo uploads (handled under Site Progress) • Client viewing of progress or formal client approvals

	• Portfolio-level project status updates • Detailed resource scheduling or manpower planning • Financial or cost-related task tracking • Any system administration activities
--	--

6. Identify the swimlanes

Table 6.1: Epic 1 - Project & Portfolio Management Process - Swimlanes

Swimlane	Main responsibilities in the process
CEO	Provides overall approval for major projects when required and reviews the portfolio of projects at a high level.
Project Manager	Receives client acceptance, creates the project record, defines milestones, updates project status, and maintains the project list/portfolio overview.
Assistant Project Manager	Supports the Project Manager in creating project records, entering project details, and updating status information.
Quantity Surveyor	Provides cost-related inputs (if needed) when the project is being set up and may review basic project information.
Administrative Officer	Assists with basic documentation, filing of project records, and maintaining simple project lists (currently using spreadsheets or shared folders).
Client (Project Owner)	Provides formal acceptance of the proposal, which triggers the start of the process, and may later receive high-level project status updates.

Table 6.2: Epic 2 - Site Progress & Field Capture Process- Swimlane

Swimlane	Main responsibilities in the process
Site Engineer	Records daily progress on site, takes progress photos, reports issues or observations, and sends the information to the Project Manager (currently via WhatsApp or email).
Project Manager	Receives daily progress updates and photos from the Site Engineer, reviews the information, asks for clarification if needed, and uses it to monitor site performance.
Assistant Project Manager	Supports the Project Manager by collecting, organising, or forwarding site progress information when required.
CEO	Occasionally reviews high-level site progress summaries or significant issues escalated by the Project Manager.
Administrative Officer	May help store or file progress photos and reports in shared folders or email archives.
Client (Project Owner)	Does not directly participate in daily site capture but may later receive selected progress information shared by the Project Manager.

Table 6.3: Epic 3 - Client Collaboration Portal Process - Swimlanes

Swimlane	Main responsibilities in the process
Project Manager	Prepares and shares project progress updates, photos, and documents with the client. Receives client feedback or approvals and records the response.
Assistant Project Manager	Supports the Project Manager in preparing and sending progress information or documents to the client when required.
Client (Project Owner)	Receives progress updates and documents, reviews the information, and provides feedback, change requests, or formal approval.
Client Representative	Acts on behalf of the Client (Project Owner) to review shared information and communicate feedback or approvals to Prismo Constructions.
Administrative Officer	Assists in preparing documents, attaching files, and maintaining records of communications sent to and received from the client.
CEO	May be involved in high-level client communications or when major approvals or escalations are required.

Table 6.4: Epic 4 - Task & Assignment Management Process - Swimlanes

Swimlane	Main responsibilities in the process
Project Manager	Identifies work to be done, creates tasks, assigns tasks to Site Engineers, monitors task progress, and marks or confirms tasks as completed.
Assistant Project Manager	Supports the Project Manager in creating tasks, communicating assignments, and following up on task status when required.
Site Engineer	Receives assigned tasks, carries out the work on site, updates the task status (e.g., In Progress / Completed), and provides basic confirmation or evidence of completion.
Administrative Officer	May help record task lists or maintain simple tracking sheets (currently using spreadsheets or shared documents).
CEO	Occasionally reviews high-level task progress or escalated issues related to critical tasks.
Quantity Surveyor	May provide input on task scope or quantities when tasks are related to measurable work items (limited involvement).

7. Extract the process activities

Table 7.1: Epic 1 - Project & Portfolio Management - Process Activities

No.	Activity	Responsible Swimlane
1	Receive client acceptance confirmation	Project Manager
2	Review accepted proposal details	Project Manager
3	Creating new project record	Project Manager / Assistant Project Manager
4	Enter basic project information (name, client, location, dates)	Project Manager / Assistant Project Manager
5	Define major project milestones	Project Manager
6	Record milestones in project documentation	Project Manager / Administrative Officer
7	Set initial project status	Project Manager
8	Update project list / portfolio overview	Project Manager / Administrative Officer
9	Share project creation confirmation internally	Project Manager
10	Review portfolio of projects (when required)	CEO / Project Manager
11	Update overall project status as work progresses	Project Manager
12	Store project records in shared folder or email archive	Administrative Officer

Table 4.2: Epic 2 - Site Progress & Field Capture - Process Activities

No.	Activity	Responsible Swimlane
1	Arrive at site and observe daily work	Site Engineer
2	Record daily progress details (work done, manpower, weather)	Site Engineer
3	Take progress photographs on site	Site Engineer
4	Add notes or captions to photographs	Site Engineer
5	Identify and note any site issues or observations	Site Engineer
6	Prepare daily progress message / report	Site Engineer
7	Send progress update and photos via WhatsApp or email	Site Engineer
8	Receive daily progress update and photos	Project Manager

9	Review submitted progress information	Project Manager
10	Request clarification if information is incomplete	Project Manager
11	Provide additional details or corrected information	Site Engineer
12	Store progress photos and messages in chat or folder	Project Manager / Administrative Officer
13	Escalate significant issues if required	Project Manager
14	Use progress information for internal monitoring	Project Manager / CEO

Table 7.3: Epic 3 - Client Collaboration Process - Process Activities

No.	Activity	Responsible Swimlane
1	Prepare project progress update or summary	Project Manager
2	Collect relevant progress photos and documents	Project Manager / Assistant Project Manager
3	Draft message or email to the client	Project Manager
4	Attach photos and documents to the message	Project Manager / Administrative Officer
5	Send progress update and documents to client	Project Manager
6	Receive progress update and documents	Client (Project Owner) / Client Representative
7	Review shared progress information and files	Client (Project Owner) / Client Representative
8	Request clarification or additional information	Client (Project Owner) / Client Representative
9	Provide additional details or corrected files	Project Manager
10	Give feedback, request changes, or provide approval	Client (Project Owner) / Client Representative
11	Receive client feedback or approval	Project Manager
12	Record client response in email or chat history	Project Manager / Administrative Officer
13	Inform internal team of client decision	Project Manager
14	Store communication records for future reference	Administrative Officer

Table 7.4: Epic 4 - Task & Assignment Management - Process Activities

No.	Activity	Responsible Swimlane
1	Identify work that needs to be carried out	Project Manager
2	Break down work into individual tasks	Project Manager
3	Define task details (description, priority, due date)	Project Manager
4	Create task list (spreadsheet, note, or message)	Project Manager / Assistant Project Manager
5	Assign task to specific Site Engineer	Project Manager
6	Communicate task assignment via WhatsApp or email	Project Manager / Assistant Project Manager
7	Receive assigned task	Site Engineer
8	Clarify task requirements if needed	Site Engineer / Project Manager
9	Start work on the assigned task	Site Engineer
10	Update task status (In Progress / Completed)	Site Engineer
11	Send completion confirmation or evidence	Site Engineer
12	Review task completion	Project Manager
13	Mark task as completed or request rework	Project Manager
14	Update task tracking list or spreadsheet	Project Manager / Administrative Officer

8. Identify decision points

Table 8.1: Epic 1 - Project & Portfolio Management - Decision Points

Decision Question	Possible Outcomes
Has the client formally accepted the proposal?	Yes → Proceed to create project No → Do not create project / Wait for acceptance
Is all required project information available?	Yes → Create project record No → Request missing information
Are the major milestones clearly defined?	Yes → Record milestones No → Further discussion needed to define milestones
Does the project require CEO approval before creation?	Yes → Send for CEO approval No → Project Manager can create directly
Is the project information correctly entered?	Yes → Finalise project record No → Correct the information

Should the project status be updated?	Yes → Update status and portfolio No → Keep current status
Is the portfolio overview up to date?	Yes → Ready for management review No → Update project list

Table 8.2: Epic 2 - Site Progress & Field Capture - Decision Points

Decision Question	Possible Outcomes
Is there meaningful work progress or an issue to report today?	Yes → Proceed to record progress No → No update required for the day
Are progress details complete (work done, manpower, weather)?	Yes → Proceed to take photos No → Gather missing information first
Are clear progress photographs available?	Yes → Attach/share photos No → Take additional photos or proceed without
Is there any site issue, delay, or observation to report?	Yes → Record and report the issue No → Submit normal progress update only
Is the progress information clear and sufficient?	Yes → Accept the update No → Request clarification from Site Engineer
Does the reported issue require immediate escalation?	Yes → Escalate to CEO or senior management No → Handle at Project Manager level
Should the progress information be stored for records?	Yes → Save in chat/folder No → Keep only in temporary messages

Table 8.3: Epic 3 - Client Collaboration Process - Decision Points

Decision Question	Possible Outcomes
Is there new progress information or documents to share with the client?	Yes → Prepare and send update No → No communication required at this time
Are the progress photos and documents ready and complete?	Yes → Send to client No → Collect missing items first
Has the client reviewed the shared information?	Yes → Wait for feedback/approval No → Follow up with the client
Does the client request clarification or additional information?	Yes → Provide additional details No → Proceed to feedback/approval stage
Does the client approve the submitted progress/documents?	Yes → Record approval and proceed No → Receive feedback or change request
Are changes requested by the client acceptable?	Yes → Make adjustments and resubmit No → Discuss further with client / escalate
Should the client response be recorded and shared internally?	Yes → Save and inform the team No → Keep only in personal communication

Table 8.4: Epic 4 - Task & Assignment Management - Decision Points

Decision Question	Possible Outcomes
Is there work that needs to be broken down into tasks?	Yes → Create tasks No → No new tasks required at this time
Are task details (description, priority, due date) clear?	Yes → Proceed to assign No → Clarify task details first
Is the correct Site Engineer available for the task?	Yes → Assign the task No → Reassign or wait for availability
Has the Site Engineer understood the task requirements?	Yes → Start work No → Provide clarification
Is the task completed satisfactorily?	Yes → Mark as completed No → Request rework or additional work
Does the completed task require evidence or confirmation?	Yes → Request and review evidence No → Accept verbal/status update
Should the task tracking list be updated?	Yes → Update spreadsheet or list No → Keep current status

9. Identify handovers and waiting points

Table 9.1: Epic 1 - Project & Portfolio Management - Handovers

From	To	Information or Document Transferred	Possible Issue
Client (Project Owner)	Project Manager	Formal acceptance of proposal / confirmation message	Acceptance may be unclear, delayed, or incomplete
Project Manager	Assistant Project Manager	Project details and instruction to create record	Miscommunication of project information
Project Manager	Administrative Officer	Project details for recording and filing	Incomplete or incorrect details entered
Project Manager	Quantity Surveyor	Basic project information (if cost input needed)	Delayed response or missing cost-related data
Project Manager	CEO	Request for approval (for major projects)	Waiting for approval causes delay in project creation
Administrative Officer	Project Manager	Confirmation that project record is created	Record may not be updated in the portfolio list
Project Manager	Internal Team	Notification that new project has been created	Team members may not receive or notice the update

Project Manager	CEO	Updated portfolio / project status overview	Portfolio information may be outdated or incomplete
-----------------	-----	---	---

Table 9.2: Epic 2 - Site Progress & Field Capture - Handovers

From	To	Information or Document Transferred	Possible Issue
Site Engineer	Project Manager	Daily progress update (text message)	Information may be incomplete, unclear, or delayed
Site Engineer	Project Manager	Progress photographs	Photos may be missing, low quality, or without captions
Site Engineer	Project Manager	Issue / observation report	Issues may be poorly described or not escalated properly
Project Manager	Site Engineer	Request for clarification or additional details	Site Engineer may respond late or incompletely
Site Engineer	Project Manager	Corrected or additional progress information	Multiple back-and-forth messages cause delays
Project Manager	Assistant Project Manager	Forwarded progress updates or photos	Information may get lost or not properly organised
Project Manager	Administrative Officer	Progress photos and messages for filing	Files may be stored inconsistently or hard to find later
Project Manager	CEO	Escalated significant site issues	Escalation may be delayed or incomplete
Project Manager	Internal Team	Summary of site progress	Team members may not receive timely updates

Table 9.3: Epic 3 - Client Collaboration Process - Handovers

From	To	Information or Document Transferred	Possible Issue
Project Manager	Client (Project Owner)	Project progress update message	Update may be delayed, incomplete, or unclear
Project Manager	Client (Project Owner)	Progress photographs	Photos may be missing, low quality, or without context
Project Manager	Client (Project Owner)	Project documents / reports	Wrong version or incomplete documents may be sent

Client (Project Owner)	Project Manager	Feedback, comments, or change requests	Feedback may be vague or delayed
Client (Project Owner)	Project Manager	Formal approval or rejection	Approval may be unclear or take a long time
Project Manager	Assistant Project Manager	Instructions to prepare or send client update	Miscommunication of what needs to be shared
Project Manager	Administrative Officer	Documents and messages for recording	Records may be incomplete or hard to retrieve later
Client Representative	Project Manager	Client's decision or feedback (on behalf of client)	Message may not clearly represent the client's view
Project Manager	Internal Team	Client's feedback or approval decision	Team may not be informed promptly
Project Manager	CEO	Escalated client concerns or major decisions	Escalation may be delayed

Table 9.4: Epic 4 - Task & Assignment Management - Handovers

From	To	Information or Document Transferred	Possible Issue
Project Manager	Site Engineer	Task assignment (description, priority, due date)	Task details may be unclear or incomplete
Project Manager	Assistant Project Manager	Instructions to create or communicate tasks	Miscommunication of task requirements
Site Engineer	Project Manager	Request for clarification on task	Clarification may take time and delay work
Project Manager	Site Engineer	Clarified task instructions	Additional messages may still leave confusion
Site Engineer	Project Manager	Task status update (In Progress / Completed)	Status updates may be delayed or missing
Site Engineer	Project Manager	Completion confirmation or evidence (photo/message)	Evidence may be insufficient or unclear
Project Manager	Site Engineer	Request for rework or additional work	Rework instructions may not be clearly understood
Project Manager	Administrative Officer	Task list or tracking sheet for updating	Tracking sheet may not be updated promptly

Administrative Officer	Project Manager	Updated task tracking information	Information may be outdated or incomplete
Project Manager	CEO	Escalated critical task delays or issues	Escalation may be late

10. Draw the As-Is UML Activity Diagram

12. Analyze the current process

Table 12.1: Epic 1 - Project & Portfolio Management - Analyze Current Process

No.	Problem Identified	Evidence from the Process	Business Impact
1	Heavy dependence on manual tools (email, WhatsApp, spreadsheets)	Project creation, milestone recording, and portfolio updates are done using emails, chat messages, and shared spreadsheets	High risk of data loss, version conflicts, and inconsistent project information
2	Delays caused by multiple waiting points	Process waits for client acceptance, missing information, and CEO approval before a project can be created	Slow project initiation reduces responsiveness and delays the start of construction management work
3	Incomplete or unclear project information	Project Manager frequently needs to request missing details from the Client before creating the project record	Rework and back-and-forth communication increase administrative effort and slow down the process
4	No single source of truth for project data	Project details and status are scattered across emails, WhatsApp chats, and different spreadsheets	Management cannot get a reliable and up-to-date view of all projects
5	Portfolio overview is manually maintained and often outdated	Administrative Officer updates the shared project list manually after project creation or status changes	CEO and Project Managers make decisions based on incomplete or old information
6	Weak visibility and control for senior management	CEO only reviews the portfolio when requested; there is no automatic or real-time dashboard	Difficulty in monitoring multiple projects, especially as the company expands into construction management
7	High dependence on individual knowledge and memory	Critical project information is stored in personal emails or chat histories of the Project Manager	Knowledge is lost if staff leave or are unavailable; poor continuity for newly appointed employees

Table 12.2: Epic 2 - Site Progress & Field Capture - Analyze Current Process

No.	Problem Identified	Evidence from the Process	Business Impact
1	Heavy reliance on WhatsApp and informal messages	Site Engineer sends daily progress, photos, and issues mainly through WhatsApp or email	Information is scattered, difficult to search, and easily lost in chat history
2	Delayed or missing daily progress updates	Process depends on Site Engineer remembering and finding time to send the update	Project Manager lacks real-time visibility of site performance

3	Incomplete or low-quality progress information	Progress details or photos are often unclear, missing captions, or incomplete	Project Manager must request clarification, causing delays and extra work
4	No structured format for progress logs or issue reports	Information is written in free-text messages without standard fields	Difficult to compare progress across days or projects; poor data quality
5	Photos and documents are poorly organised	Progress photos are stored in WhatsApp chats or random shared folders	Hard to retrieve evidence later for client reporting or dispute resolution
6	Weak escalation and issue tracking	Significant site issues are escalated manually and may not be properly followed up	Problems remain unresolved longer, increasing project risk and cost
7	High dependency on individual communication habits	Newly appointed Site Engineers may follow different styles of reporting	Inconsistent information quality and difficulty in training new staff during expansion

Table 12.3: Epic 3 - Client Collaboration Portal - Analyze Current Process

No.	Problem Identified	Evidence from the Process	Business Impact
1	Communication depends heavily on email and WhatsApp	Progress updates, photos, and documents are sent to clients mainly through email or WhatsApp	Information is scattered across personal inboxes and chat histories, making retrieval difficult
2	Delayed sharing of progress information	Project Manager must manually prepare and send updates; no automatic or scheduled sharing	Clients experience lack of transparency and reduced trust in the company
3	No standard format for progress updates or documents	Content and quality of updates vary depending on the Project Manager	Clients receive inconsistent information, leading to confusion and repeated clarification requests
4	Difficulty in tracking client feedback and approvals	Client responses are recorded only in email threads or chat history	Approvals or change requests can be missed, delayed, or forgotten
5	Version control problems with shared documents	Multiple versions of the same document may be sent without clear version tracking	Clients and internal team may work with outdated or incorrect information
6	Slow response and multiple back-and-forth cycles	Clarification requests and change discussions happen through long email/WhatsApp chains	Project progress is delayed while waiting for client decisions
7	Limited visibility for clients	Clients can only see what is manually shared with them; no self-service access	Poor client experience, especially as the company expands into full construction management

Table 12.4: Epic 4 - Task & Assignment Management - Analyze Current Process

No.	Problem Identified	Evidence from the Process	Business Impact
1	Tasks are created and assigned using informal methods	Tasks are communicated mainly through WhatsApp messages, emails, or simple spreadsheets	Task details can be unclear, lost, or misunderstood by Site Engineers
2	No standardised task format or tracking system	Task description, priority, and due date are written in free text without consistent structure	Difficult to monitor multiple tasks and compare progress across projects
3	Delayed status updates from Site Engineers	Site Engineers update task status only when they remember or are reminded	Project Manager lacks real-time visibility of work progress
4	Frequent clarification loops between PM and Site Engineer	Site Engineers often need to request clarification because task instructions are incomplete	Wasted time and slower task execution
5	Weak tracking of task completion and evidence	Completion is confirmed through messages or photos that are not systematically stored	Difficult to verify work done and maintain accountability
6	Manual and inconsistent task list maintenance	Task tracking sheets are updated manually by Project Manager or Administrative Officer	Tracking lists become outdated quickly, leading to missed or duplicated work
7	Poor support for newly appointed Site Engineers	New staff receive tasks through informal channels without clear process guidance	Higher chance of errors and longer learning curve during the company's expansion

13. Identify measurable baseline indicators

Table 13.1: Epic 1 - Project & Portfolio Management - KPI

KPI	How it could be measured
Average time to create a project after client acceptance	Measure the number of hours/days from receiving client acceptance until the project record is fully created
Percentage of projects created with missing information	$(\text{Number of projects that required additional information requests} \div \text{Total projects created}) \times 100$
Average waiting time for CEO approval	Measure the average time taken from sending the approval request to receiving CEO decision
Percentage of portfolio records that are outdated	$(\text{Number of projects with incorrect or old status in the portfolio list} \div \text{Total projects in portfolio}) \times 100$

Number of manual data-entry points	Count the number of times project information is manually typed or copied (email → spreadsheet → folder, etc.)
Average time to update overall project status	Measure the average time taken to manually update the project status after a significant change
Percentage of projects with clearly defined milestones at creation	$(\text{Number of projects that had complete milestones recorded at creation} \div \text{Total projects created}) \times 100$

Table 13.2: Epic 2 - Site Progress & Field Capture - KPI

KPI	How it could be measured
Average time to submit daily progress update	Measure the average time from end of workday until the Site Engineer sends the progress update
Percentage of daily progress updates that are incomplete	$(\text{Number of updates missing key details such as manpower, work done, or photos} \div \text{Total updates received}) \times 100$
Average number of clarification requests per progress update	$\text{Total clarification messages sent by Project Manager} \div \text{Total progress updates received}$
Percentage of progress photos without captions or context	$(\text{Number of photos sent without notes/captions} \div \text{Total photos received}) \times 100$
Average time to escalate a significant site issue	Measure the time from when the issue is first reported until it is escalated to the CEO or senior management
Number of manual data-entry / storage points	Count how many times progress information is manually copied (WhatsApp → email → folder → spreadsheet)
Percentage of working days with no progress update received	$(\text{Number of working days with no update from Site Engineer} \div \text{Total working days}) \times 100$

Table 13.3: Epic 3 - Client Collaboration Portal - KPI

KPI	How it could be measured
Average time to share progress update with client	Measure the average time from when progress information is available until it is sent to the client
Percentage of client updates that require clarification	$(\text{Number of updates where client requested additional information} \div \text{Total updates sent}) \times 100$
Average time taken by client to provide feedback or approval	Measure the average number of days from sending the update until the client responds

Percentage of documents shared with version confusion	$(\text{Number of cases where client or team used an incorrect document version} \div \text{Total documents shared}) \times 100$
Average number of back-and-forth messages per client approval	$\text{Total messages exchanged regarding one approval} \div \text{Number of approvals requested}$
Percentage of client approvals that are delayed beyond expected time	$(\text{Number of approvals received later than the expected response time} \div \text{Total approval requests}) \times 100$
Number of manual steps required to share and record client communication	Count the number of manual actions (prepare message, attach files, send, save to folder, inform team)

Table 13.4: Epic 4 - Task & Assignment Management - KPI

KPI	How it could be measured
Average time to assign a task after it is identified	Measure the average time from identifying the work until the task is communicated to the Site Engineer
Percentage of tasks that require clarification	$(\text{Number of tasks where Site Engineer requested clarification} \div \text{Total tasks assigned}) \times 100$
Average time for Site Engineer to update task status	Measure the average time from task assignment until the first status update is received
Percentage of tasks completed without proper evidence	$(\text{Number of completed tasks without photo or clear confirmation} \div \text{Total completed tasks}) \times 100$
Average number of rework cycles per task	$\text{Total number of rework requests} \div \text{Total tasks completed}$
Percentage of task tracking records that are outdated	$(\text{Number of tasks with incorrect status in the tracking list} \div \text{Total active tasks}) \times 100$
Number of manual data-entry points in task management	Count how many times task information is manually typed or copied (message → spreadsheet → folder, etc.)

14. Prepare a brief process assessment

14.1 Epic 1 - Project & Portfolio Management

At Prismo-Constructions the present Project & Portfolio Management process is mainly based on manual and fragmented procedures. Once a client has formally accepted a proposal, the Project Manager gets the confirmation by email or through WhatsApp, looks at the details and then sets up a project record using spreadsheets or shared documents. The milestones are established and noted down by hand, the initial project status is assigned, and the portfolio list is updated by the Administrative Officer. The CEO only looks at the portfolio when it has been asked to do so. The whole process makes use of email, chat messages and shared folders instead of having a proper system.

Major delays happen at a number of places: there is a wait for the client to provide all the information, there is a wait for the CEO's approval on some projects, and there is the time needed to manually update the portfolio list. These delays in waiting hinder the start of projects and decrease the organisation's ability to respond.

The people most affected are the Project Manager, since he has the greatest amount of coordination work to carry out, the newly appointed staff, who have difficulty dealing with the inconsistent processes, and the CEO, who does not have real-time visibility of the project portfolio; clients are also indirectly affected since project start-up takes longer than it should.

There are a number of activities which generate only limited direct business value; these consist of making repeated requests for missing information, having to manually copy project details from one file to another, and constantly checking email and chat histories to establish the most up-to-date status. The fact that these non-value-adding steps are carried out increases the amount of administrative work without leading to any improvement in the project results.

The areas that need to be improved are reducing the time that elapses after a client has been accepted, setting up a single dependable source for project information, improving the accuracy and promptness of the portfolio overview, and making sure that milestones and status are recorded in a standard way.

Before you design the To-Be process, you should gather evidence regarding the average time it takes to create a project after acceptance, how frequently information is missing, the accuracy of the current portfolio, and the number of manual data-entry steps. This baseline data will then enable a clear comparison when improvements are introduced.

14.2 Epic 2 - Site Progress & Field Capture

At Prismo Constructions the present Site Progress & Field Capture process is very informal and relies mostly on messages sent through WhatsApp and emails. Every day the Site Engineer looks at the work being done, records the details of the progress, takes photographs, notes any problems, and then sends the information to the Project Manager. The Project Manager looks over the update, asks for further explanation if necessary, keeps the information in the chat history or in folders and, when appropriate, passes on any important issues to the CEO. There is no standard template or central system for recording daily progress.

Delays happen when the Site Engineer submits the update late, when the information is incomplete, and as a result of repeated rounds of clarification between the Site Engineer and the Project Manager; escalation of serious site problems also takes up more time since it depends on manual communication.

The people most affected are the Site Engineers (in particular those who have recently been appointed), since they have to make sure that their reports are consistent, and the Project Manager, as he has to spend a lot of time gathering, checking and organising the information from the site. The CEO and the clients are also impacted since they get a delayed or incomplete view of the site's actual performance.

There are a number of activities which provide only minor direct business value; these consist of composing free-text progress messages, constantly asking for missing details, going through WhatsApp chats to look for old photos, and manually saving files into various folders. All of these steps take up time without enhancing the quality of site control.

The main areas that need to be improved are to standardise the daily progress reports, cut down on the number of clarification loops, better organise and retrieve the progress photos, and speed up the process of escalating site problems.

Before proceeding with the design of the To-Be process, evidence should be gathered regarding the average time it takes to receive daily updates, the percentage of reports that are incomplete, the number of clarification requests per week, and the length of time it currently takes to escalate critical issues. Having this baseline information will then enable an accurate comparison to be made after the process improvements have been introduced.

14.3 Epic 3 - Client Collaboration Process

At Prismo Constructions the present Client Collaboration process is mostly carried out by means of email and WhatsApp. As progress information or documents become ready, the Project Manager draws up a message, attaches the relevant photos and files, and sends them to the client. The client or their representative then looks at the information, may ask for clarification, and gives their feedback, submits change requests or provides formal approval. The Project Manager notes down the client's response in the email or chat record and lets the internal team know. There is no client portal or structured workflow.

There are major delays caused by having to wait for the Project Manager to prepare and send the updates, for having to wait for the client to review the information, and during the various clarification or revision cycles. The time spent at these waiting stages hampers decision-making and lengthens the total project timeline.

The people most affected by this situation are the Project Manager, who has a heavy workload in terms of communication, and the Client, who has only limited and delayed access to information about the progress of the project. Similarly, newly hired internal staff encounter difficulties since the client's communication procedures are not standardised.

There are a number of activities which generate only limited direct business value; these involve manually preparing similar progress messages, constantly attaching the same kinds of files, searching through lengthy email threads to find earlier approvals, and following up with clients for their replies. All of these steps take up time but contribute only insignificantly to the project outcome.

The main areas which need improving are cutting down the time it takes to send clients progress updates, making the format of the updates more standardised, improving the way in which client feedback and approvals are tracked, and giving clients clearer and more timely access to information.

Before arriving at the design of the To-Be process, evidence should be gathered regarding the average time it takes to share progress updates, the percentage of the updates that need clarification, the average client response time, and the number of back-and-forth messages required for each approval. This baseline data will then enable a clear comparison when improvements are introduced.

14.4 Epic 4 - Task & Assignment Management

At Prismo Constructions the present Task and Assignment Management process is informal and mostly relies on manual methods. If some work has to be done, the Project Manager decides what the tasks are, sets out the details in a message or in a spreadsheet and then assigns them to the Site Engineers by means of WhatsApp or email. The Site Engineer gets the task, may ask for further clarification, carries out the work, updates the status and sends a confirmation of completion or photographs. The Project Manager then looks at the results, either accepts the work or asks for it to be redone, and manually alters the tracking list. There is no structured digital system for creating, assigning or monitoring tasks.

Delays frequently happen when the Project Manager and the Site Engineer are clarifying things, while they are waiting for status reports, and also during rework cycles when the work that has been completed fails to meet expectations. The task tracking list is likewise often not updated because this is carried out manually.

The people most impacted include the Project Manager, who has to keep checking on the tasks, and the Site Engineers (in particular those who have just been appointed), who get their instructions via informal means and might find the requirements unclear. Overall project coordination is also affected due to the lack of clear visibility of the tasks.

There are a number of activities which yield only limited direct business value; these consist of composing repetitive task messages, having to continually clarify the same kind of instructions, searching the chat histories to find previous assignments, and updating the spreadsheets manually. All of these steps take up time without either improving the quality or the speed of the work.

The main areas that need to be improved are to standardise the way tasks are created and assigned, to reduce the number of clarifications required, to enhance the ability to see the status of tasks in real time, and to make it easier to track and retrieve evidence of task completion.

Evidence should be gathered beforehand concerning the average time it takes to assign a task, the percentage of tasks that need clarification, the average time it takes to receive status updates, how frequent rework is, and the present accuracy of the task tracking list. It will then be possible to make a clear comparison afterwards when the improved process has been put into place.

Appendix A

A.1 – Client Meeting Minutes

- **Meeting Title:** Initial Requirements Gathering Meeting
- **Project:** Digital Transformation Platform for Construction Consultancy
- **Organization:** Prismo Constructions
- **Date:** 9th August 2026
- **Platform:** Microsoft Teams
- **Duration:** Approximately 60 minutes (20 minutes team preparation)
- **Client Side:** Mr. Y. Senevirathne (Prismo Constructions)
- **Project Team:** Wijerathne W.A.D.C.L (IT24103929)

Rathnayaka R.M.D.D (IT24103951)

Sathsarani W.A.N.P (IT24103657)

Sandothma H.B.D (IT24201063)

Discussion Summary

1. Current Process of Starting a Project

- A client contacts Prismo Constructions for consultation.
- Requirements are discussed, and a proposal with budget is prepared.
- The proposal is sent to the client mainly through email and WhatsApp.
- Once the client accepts the proposal, the project is started.

2. Project Creation and Management

- After client acceptance, the project is created manually.
- The Project Manager records project details in a spreadsheet or shared folder.
- Milestones are defined after project creation.
- Work is assigned to site engineers mainly through WhatsApp messages.

3. Site Progress Reporting

- Site engineers currently send daily progress updates through WhatsApp.
- Photos are also shared through WhatsApp.
- If there is any issue on site, it is also informed via messages.
- The process is not structured, and information sometimes gets delayed or lost.

4. Client Communication and Approvals

- Progress summaries are prepared and sent to clients via email or WhatsApp along with photos.
- The team then waits for client feedback and approval.
- Follow-ups are often required because responses are delayed.

5. Current Challenges Confirmed by Client

- Delayed information
- Lack of real-time visibility
- Difficulty in tracking progress and approvals
- Problems are becoming more serious due to expansion into construction management and newly joining staff.

6. Proposed Solution

- The team introduced the proposed system.
- The system aims to provide a centralized platform for:
 1. Project creation
 2. Task assignment
 3. Site progress tracking
 4. Client collaboration

7. Next Steps

- The client agreed to schedule a follow-up meeting next week to discuss the detailed processes one by one.
- The student team will document the current processes and share a summary with the client.

Meeting Outcome: The meeting successfully captured the As-Is process and confirmed the key business problems. The client showed willingness to continue collaboration.

Prepared by: Student Project Team

Figure A.1.4: Client confirming challenges due to expansion into construction management

Figure A.1.5: Agreement on follow-up meeting

A.2 Glossary of Terms

Term	Definition
As-Is Process	The current state of a business process as it exists today, before any improvements or digital transformation.
To-Be Process	The future improved state of a business process after implementing changes or a new system.
Business Architecture	A blueprint that describes the structure and interaction of business processes, stakeholders, information, and capabilities of an organization.
Stakeholder	Any individual, group, or organization that can affect or is affected by the project or business process.
Power–Interest Grid	A stakeholder classification tool (also known as Mendelow’s Matrix) that categorizes stakeholders based on their level of power and interest.
Swimlane	A visual element in an Activity Diagram that represents a specific actor, role, or department responsible for a set of activities.
Activity Diagram	A UML diagram that shows the flow of activities, decisions, and handovers in a business process.
Epic	A large body of work that can be broken down into smaller processes or user stories. In this project, the four main process areas.
Handover	The point at which work, information, or responsibility is transferred from one stakeholder or role to another.
Waiting Point	A stage in the process where progress is delayed while waiting for information, approval, or action from another party.
Decision Point	A point in the process where a condition is evaluated and the flow can take alternative paths.

KPI (Key Performance Indicator)	A measurable value used to evaluate the performance and efficiency of a process.
Digital Transformation	The integration of digital technology into business processes to improve efficiency, visibility, and customer experience.
Single Source of Truth	A central and reliable location where all accurate and up-to-date information is stored and accessed.
